

# Hospital Finance Dashboard

## Business Insight & Management Report

Management-ready analysis based on the dashboard KPIs and visuals. Dashboard image intentionally excluded.

### 1. Executive Summary

The Hospital Finance Dashboard provides management with a consolidated view of hospital charges, payments, outstanding Accounts Receivable (AR), patient volume, collection performance, claims, payer contribution and AR ageing. The reported figures are **19M Total Charges**, **10.82M Total Payments**, **8.45M Outstanding AR**, **1.50K Total Patients** and a **56.15% Collection Rate**.

From a business perspective, the main opportunity is to improve revenue-cycle efficiency by converting billed charges into collections faster, reducing aged receivables, strengthening claim follow-up, and monitoring payer and department performance.

### 2. KPI Management Insights

| KPI             | Value  | Management Business Insight                                                                                  |
|-----------------|--------|--------------------------------------------------------------------------------------------------------------|
| Total Charges   | 19M    | Represents overall billed hospital service activity and establishes the billing base for financial analysis. |
| Total Payments  | 10.82M | Represents collected revenue/cash and should be monitored against charges and collection targets.            |
| Outstanding AR  | 8.45M  | Represents billed revenue still outstanding and is a major cash-flow and collection opportunity.             |
| Total Patients  | 1.50K  | Provides an indication of patient/service volume and can be compared with charges and payments.              |
| Collection Rate | 56.15% | Indicates reported collection efficiency and highlights an opportunity to improve revenue realization.       |

## 3. Visual-by-Visual Business Insights

### 1. Sum of Charge by Month

|                               |                                                                                                           |
|-------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>What it shows</b>          | Shows monthly movement of total hospital charges.                                                         |
| <b>Business insight</b>       | Monthly charges fluctuate across the reporting period, indicating changes in billing or service activity. |
| <b>Management perspective</b> | Management can identify high/low revenue months, seasonal patterns and unusual movements.                 |
| <b>Recommended action</b>     | Compare monthly charges with patient volume and payments before using the trend for forecasting.          |

### 2. Total Charge by Department

|                               |                                                                                                                       |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>What it shows</b>          | Compares charges generated by hospital departments.                                                                   |
| <b>Business insight</b>       | Some departments contribute a larger share of billed activity.                                                        |
| <b>Management perspective</b> | High-charge departments are important revenue contributors, but charges alone should not be treated as profitability. |
| <b>Recommended action</b>     | Review department charges together with payments, outstanding AR and average AR days.                                 |

### 3. Total Charges by Insurance Payer

|                               |                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>What it shows</b>          | Shows distribution of charges across insurance payer categories.                                       |
| <b>Business insight</b>       | Revenue exposure is distributed across multiple payer groups.                                          |
| <b>Management perspective</b> | A payer with a large charge share can create financial exposure if reimbursement is slow or difficult. |
| <b>Recommended action</b>     | Create a payer scorecard covering charges, payments, AR, collection rate and claim status.             |

### 4. Claims by Status

|                               |                                                                                           |
|-------------------------------|-------------------------------------------------------------------------------------------|
| <b>What it shows</b>          | Shows the distribution of claims according to their current status.                       |
| <b>Business insight</b>       | Claim status provides visibility into how billed services progress toward reimbursement.  |
| <b>Management perspective</b> | Pending or denied claims can delay cash realization and create potential revenue leakage. |
| <b>Recommended action</b>     | Track pending/denied claims, root causes, resubmission and final payment.                 |

### 5. AR Balance by Ageing Bucket

|                               |                                                                                                              |
|-------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>What it shows</b>          | Groups outstanding AR into ageing periods.                                                                   |
| <b>Business insight</b>       | Older receivables require greater management attention because collection risk generally increases with age. |
| <b>Management perspective</b> | Ageing is a key indicator of cash-flow risk and collection effectiveness.                                    |
| <b>Recommended action</b>     | Prioritize high-value and older balances, especially 91–120 and 120+ day AR.                                 |

### 6. Average Days in AR by Department

|                      |                                                     |
|----------------------|-----------------------------------------------------|
| <b>What it shows</b> | Compares average outstanding AR days by department. |
|----------------------|-----------------------------------------------------|

|                               |                                                                                         |
|-------------------------------|-----------------------------------------------------------------------------------------|
| <b>Business insight</b>       | Collection speed differs across departments.                                            |
| <b>Management perspective</b> | High AR days can indicate billing, documentation, payer processing or follow-up issues. |
| <b>Recommended action</b>     | Investigate departments above the hospital average and establish corrective actions.    |

## 7. Dashboard Filters / Slicers

|                               |                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------|
| <b>What it shows</b>          | Allows analysis by month, claim status, insurance payer and department.               |
| <b>Business insight</b>       | Filters allow management to move from an overall view to specific problem areas.      |
| <b>Management perspective</b> | This supports faster root-cause analysis and targeted decisions.                      |
| <b>Recommended action</b>     | Use combinations such as Payer → Claim Status → AR or Department → AR Days → Charges. |

## 4. Management Action Plan

| Priority | Focus Area             | Recommended Action                                                    | Expected Business Benefit                         |
|----------|------------------------|-----------------------------------------------------------------------|---------------------------------------------------|
| High     | Outstanding AR         | Prioritize aged and high-value receivables with structured follow-up  | Improved cash flow and lower collection risk.     |
| High     | Collection Rate        | Set monthly collection targets and monitor by payer and department    | Higher revenue realization.                       |
| High     | Claims                 | Create worklists for pending and denied claims and monitor resolution | Reduced revenue leakage and faster reimbursement. |
| High     | AR Ageing              | Escalate 91–120 and 120+ day balances.                                | Lower aged-AR and collection risk.                |
| Medium   | Payer Performance      | Compare payer charges, payments, AR and claim outcomes.               | Better payer management.                          |
| Medium   | Department Performance | Investigate departments with high AR days and process bottlenecks     | Faster revenue cycle.                             |
| Medium   | Monthly Trends         | Use charge trends with patient volume and payments for forecasting    | Better budgeting and planning.                    |

## 5. Overall Management Conclusion

**Increase collections → Reduce outstanding AR → Control aged receivables → Improve claim processing → Monitor payer and department performance.**

The dashboard should be used as a revenue-cycle management tool, not only as a reporting tool. Regular review of these indicators can help management identify collection bottlenecks, reduce revenue leakage, improve cash flow and support better financial planning.
